WHY?

## The 3 Typical Reactions When I say IP is ready TODAY

A:

ah really, cool?! Please show me; would be great but **vendors typically overpromise and don't talk about the problems**  
*that's why I present here our strategy and our experiences*

B:

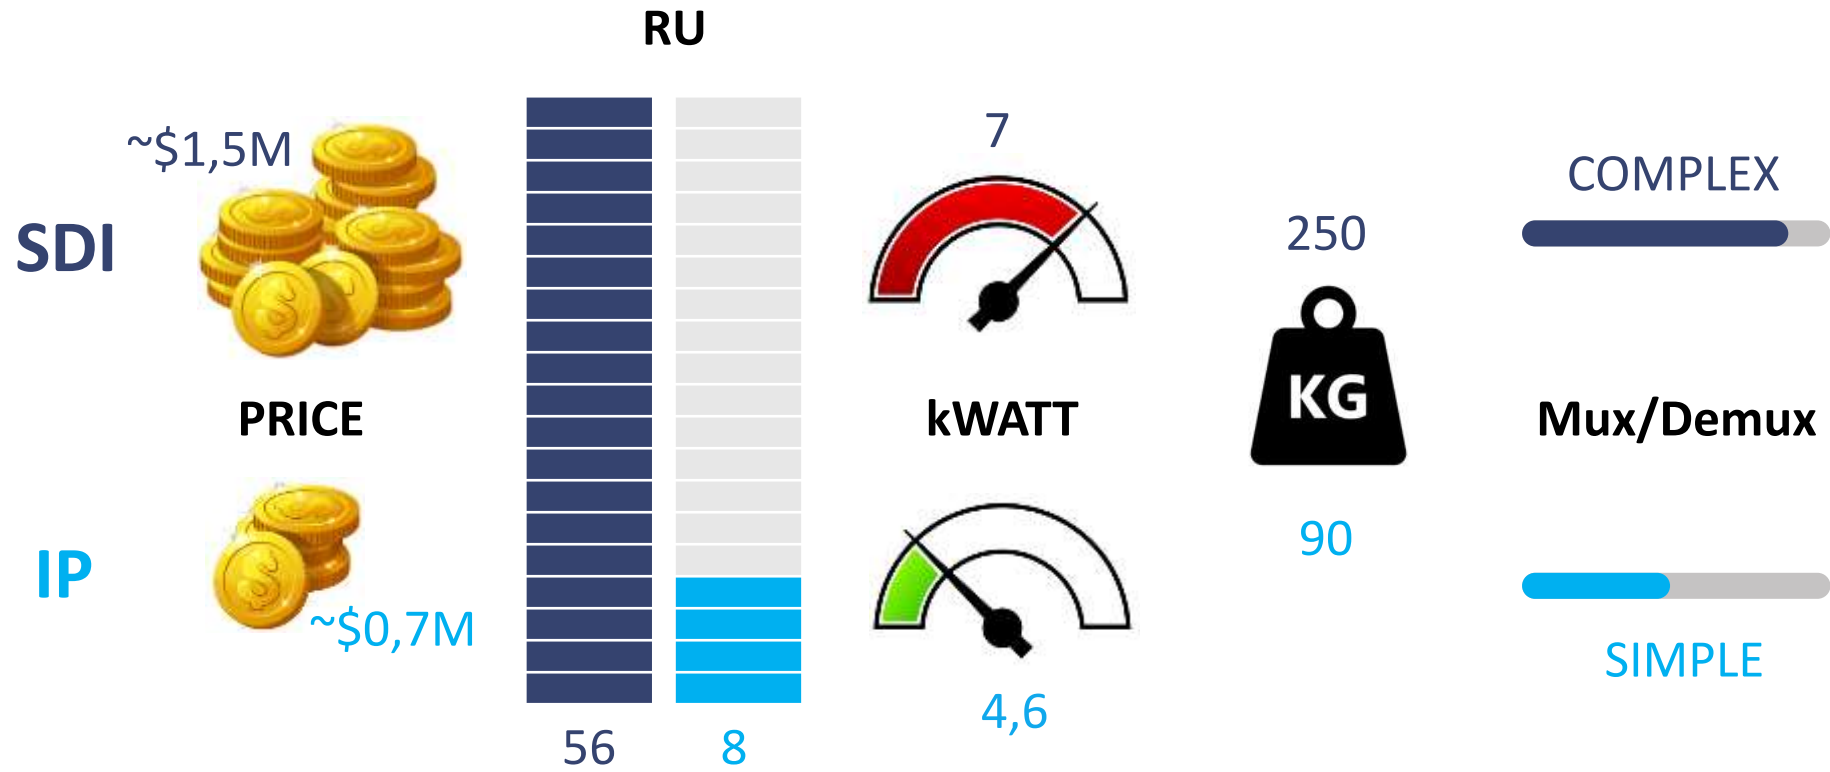

hmm – maybe – but **it's too expensive, too complicated** to build and maintain and simply I do not have personnel for it  
*fair points – let's look into these in more detail*

C:

fine – but I hope **I will be retired when it hits my company...**  
*great plan – please share how you do and finance it and I will follow up*

# SDI vs IP Core $\sim 256^2$ UHD / $1024^2$ HD

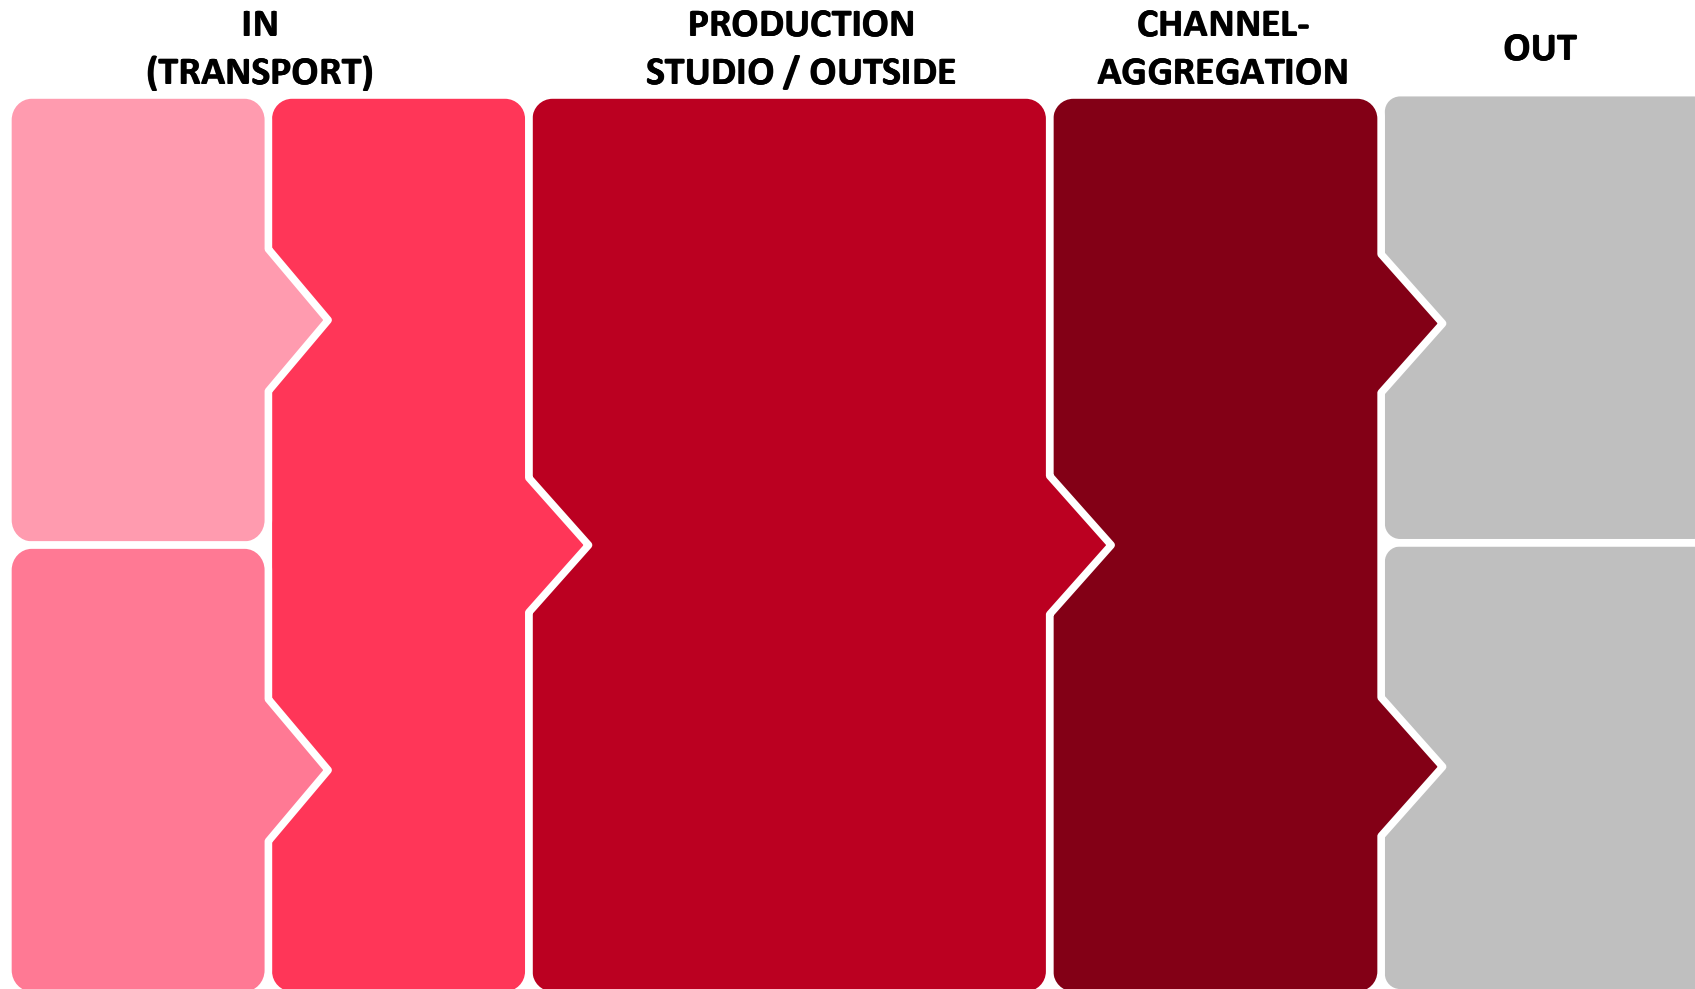

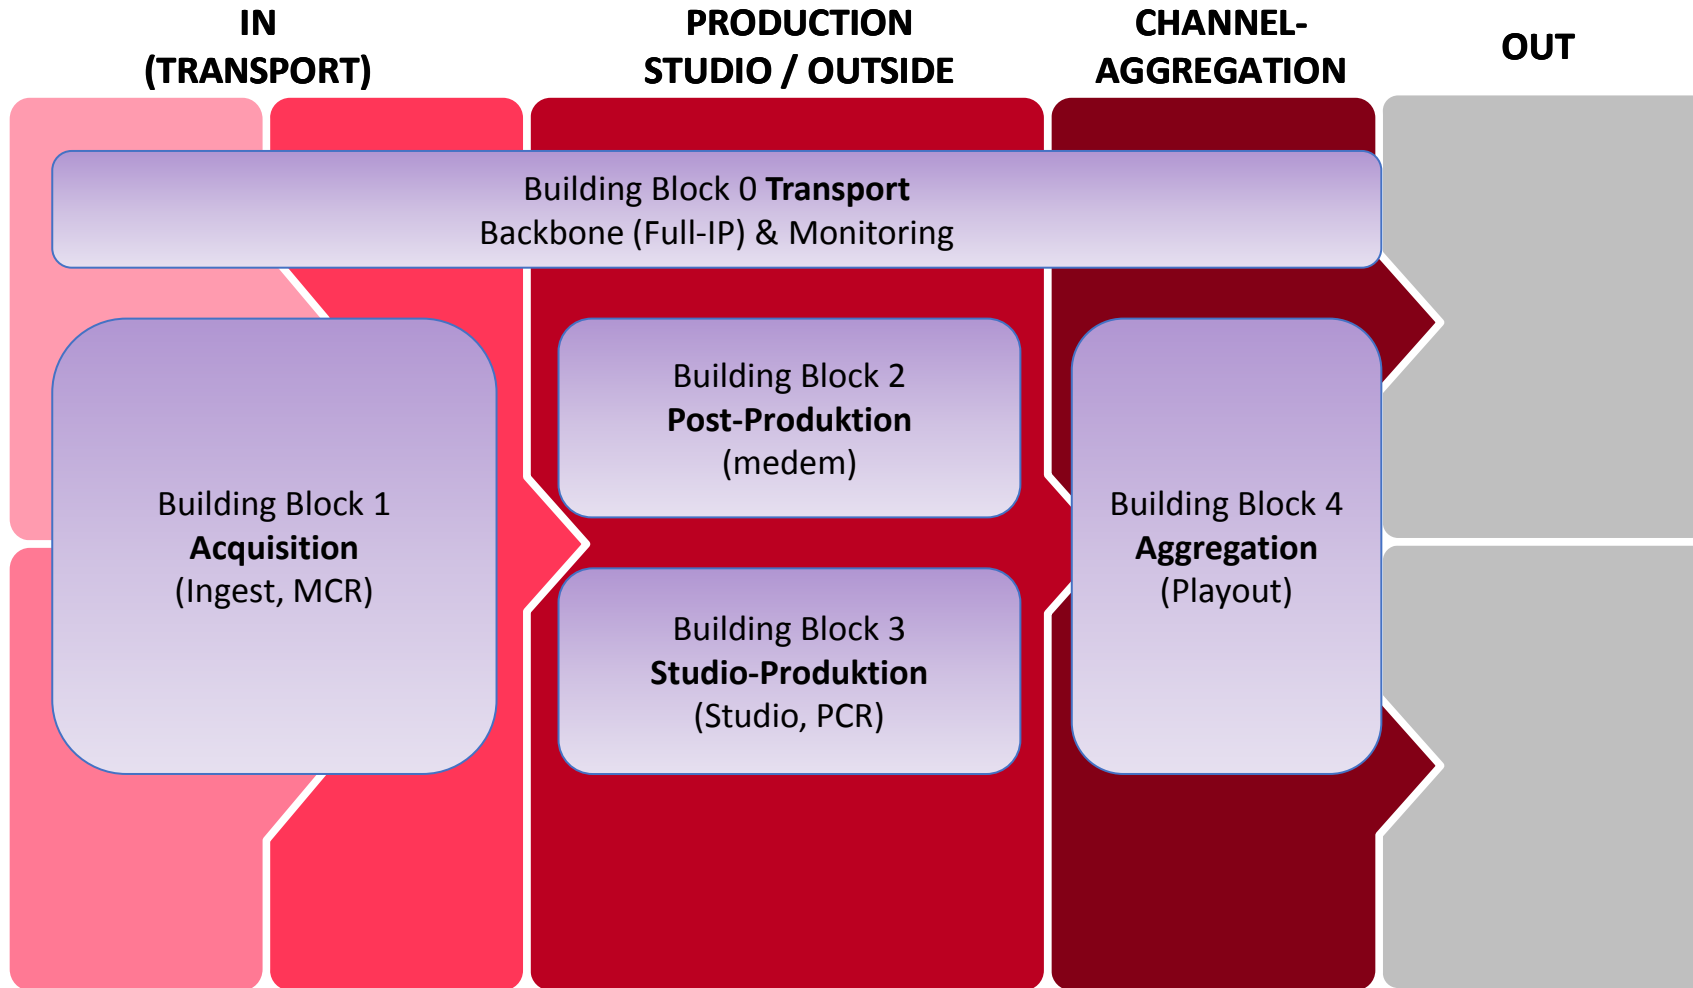

# News-, Sports- and Technology Building

# Project Perimeter of “Metetechno”

# Project Perimeter of “Metetechno”

# Metecho Technology - Full-IP SMPTE 2110

## AV Signal Transport in the News-, Sports- & Technologycenter will be Full-IP

- In-house SMPTE 2110
- External Connections via SMPTE 2022
- SDI Peripherals via Gateway – No hybrid SDI Infrastructure

## Why now?

- Commitment to Project and Company Goals → Flexibility, Scalability, future-proof
- Benefits of the «greenfield approach»
- Risks are getting smaller (AIMS, SMPTE 2110 standard approved, AMWA)

## Benefits for operation

- Get your signals easier
- Process optimization and automation

## The Core Format for HD & UHD

METADATA

- ST 2110-10 System Timing**
- ST 2110-20 Uncompressed Video**
- ST 2110-21 Traffic Shaping Uncompressed Video**
- ST 2110-22 Compressed Video Essence
- ST 2110-30 PCM Audio**
- ST 2110-31 AES3 Transparent Transport**
- ST 2110-40 Ancillary Data
- ST 2022-08 Integration with ST 2022-6**

# Metecho Technology - Full-IP SMPTE 2110

## Decision Process

**tpc** | TECHNOLOGY  
CERTIFICATION  
SYSTEM

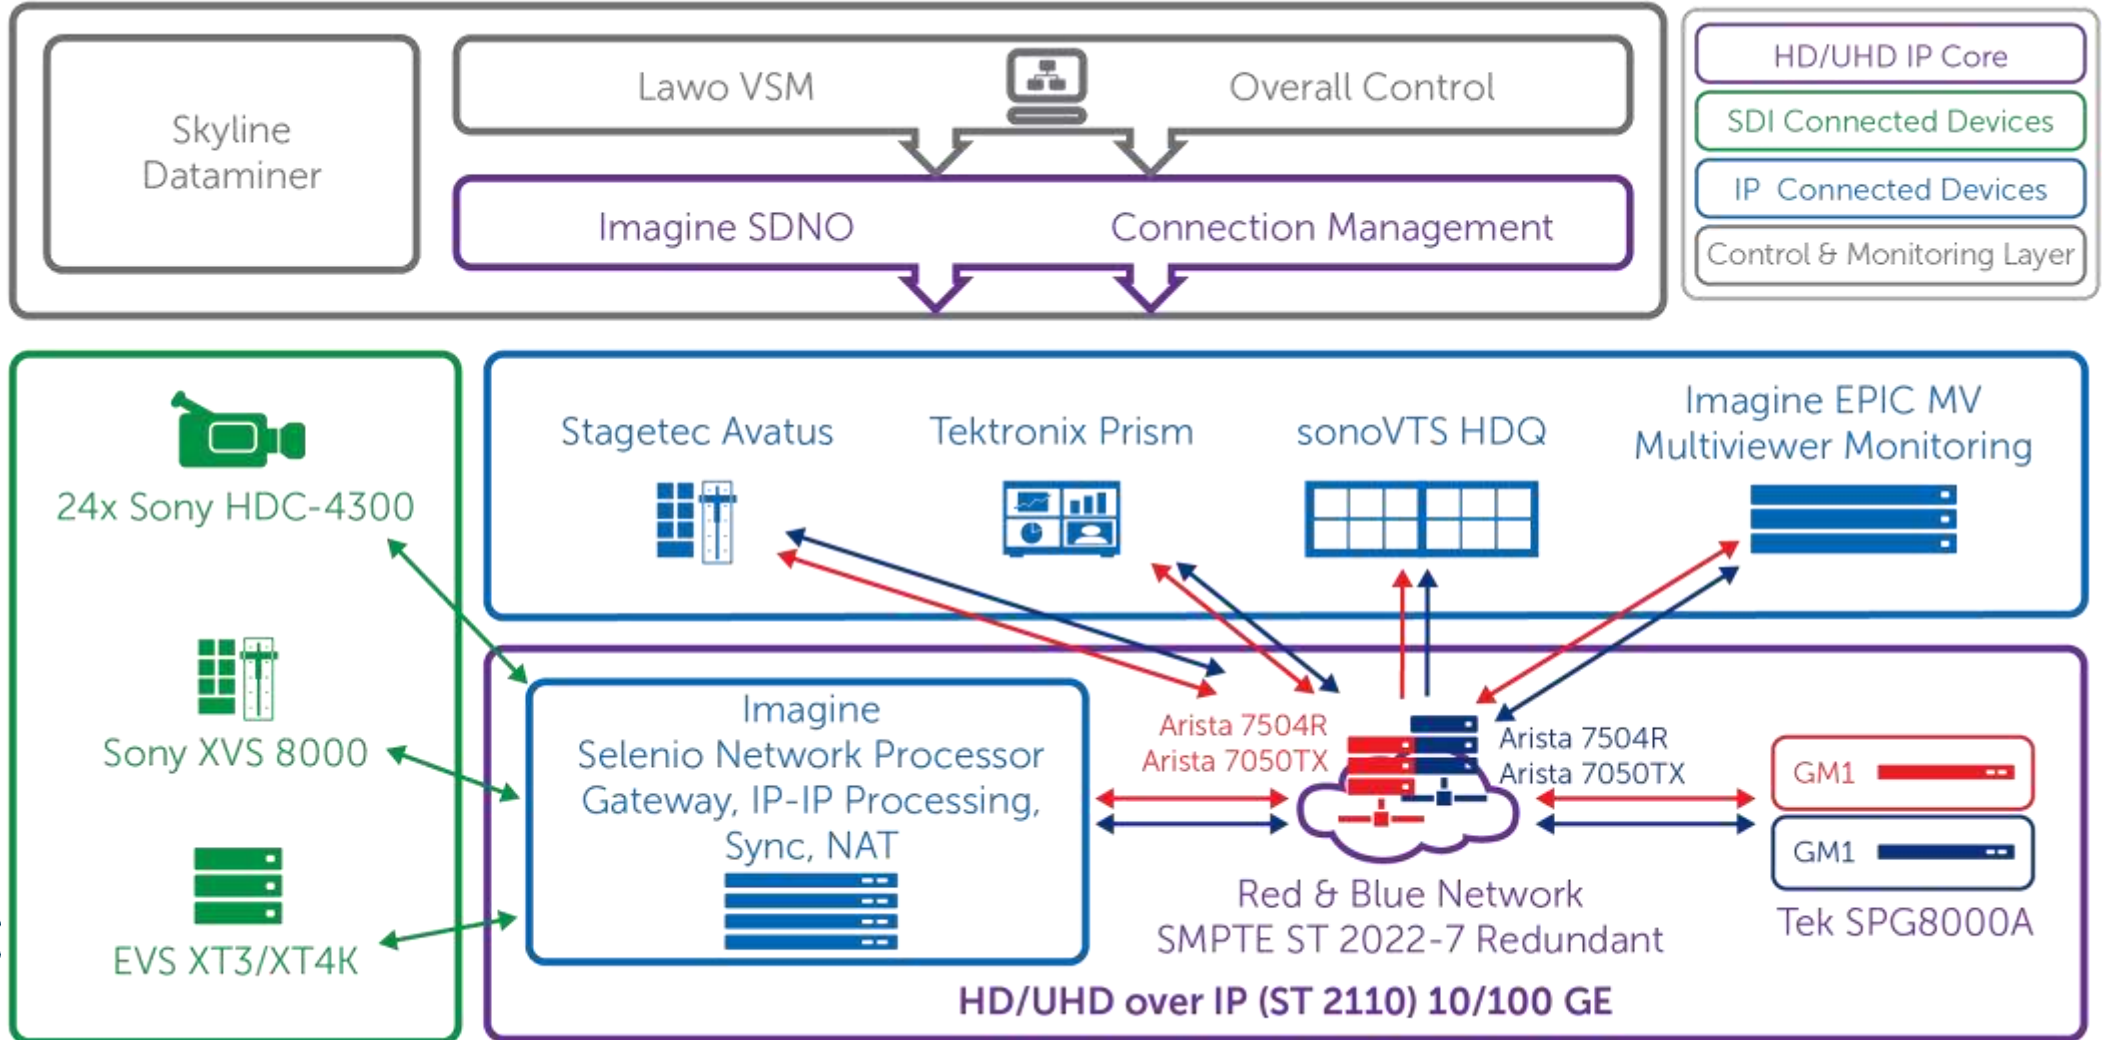

## UHD-1 HDR

- Length: 16.5 m; 54ft
- With: 2.5/5.6m; 8.2/18.4ft
- Weight: 39t; 165k lb
- Power: 2 x CEE 63
- Up to 24 UHD-Cameras
- 288 Audio Channels (5.1)
- HD/UHD opt. HDR

# Technical Overview UHD-1 HDR

# IP Concept

No SDI or AES Router → Full IP Backbone

Compared to SDI: ~184x184 UHD Videomatrix

Extensions can be made easy

SDI / AES3 Sources via Gateways to ST 2110

Full IP to EPIC Multiviewer

COTS Network but Datacenter Class

Non-Blocking Network Architecture (Building will be Blocking!)

Uncompressed Video (up to 12Gbit/s)

“Proxy” Generation of each source → Orchestrator switches i.e. Proxy to Multiviewer

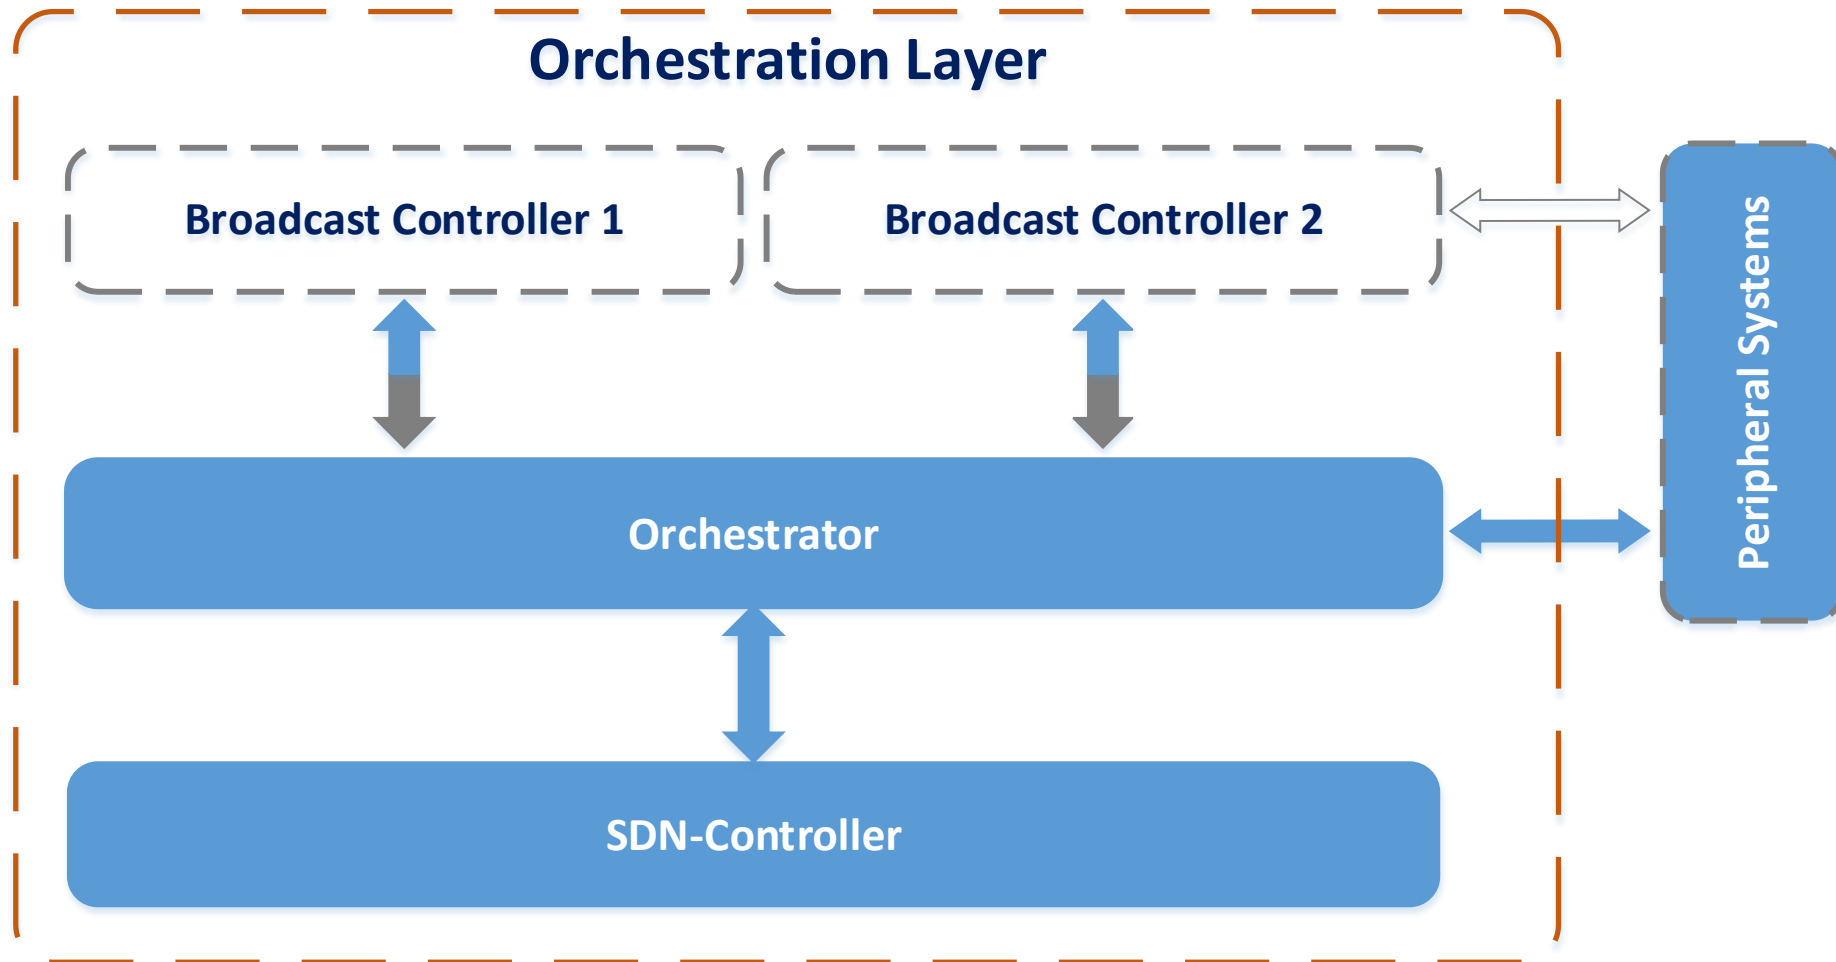

No IS-04 or IS-05 in the Truck → More than 50k Multicast IP-Adresses!

# Redundancy

- What if a Switch Fails?
- What if the Optics Fail?
- What if a cable Fails?
  
- ST 2022-7 Redundancy
  - Send ***Two Copies***
  - On ***Two Interfaces***
  - To ***Two Switches***
  - Join and Receive from both
  - Packet-by-packet merge
  - **Also used for all parts of SMPTE ST 2110!**

# ARCHITECTURE

## The «MATRIX»

- 11 Tb/s max throughput
- 108 x 100GE ports (x2)
- In theory: 1000 x 1000 UHD (if fully loaded)

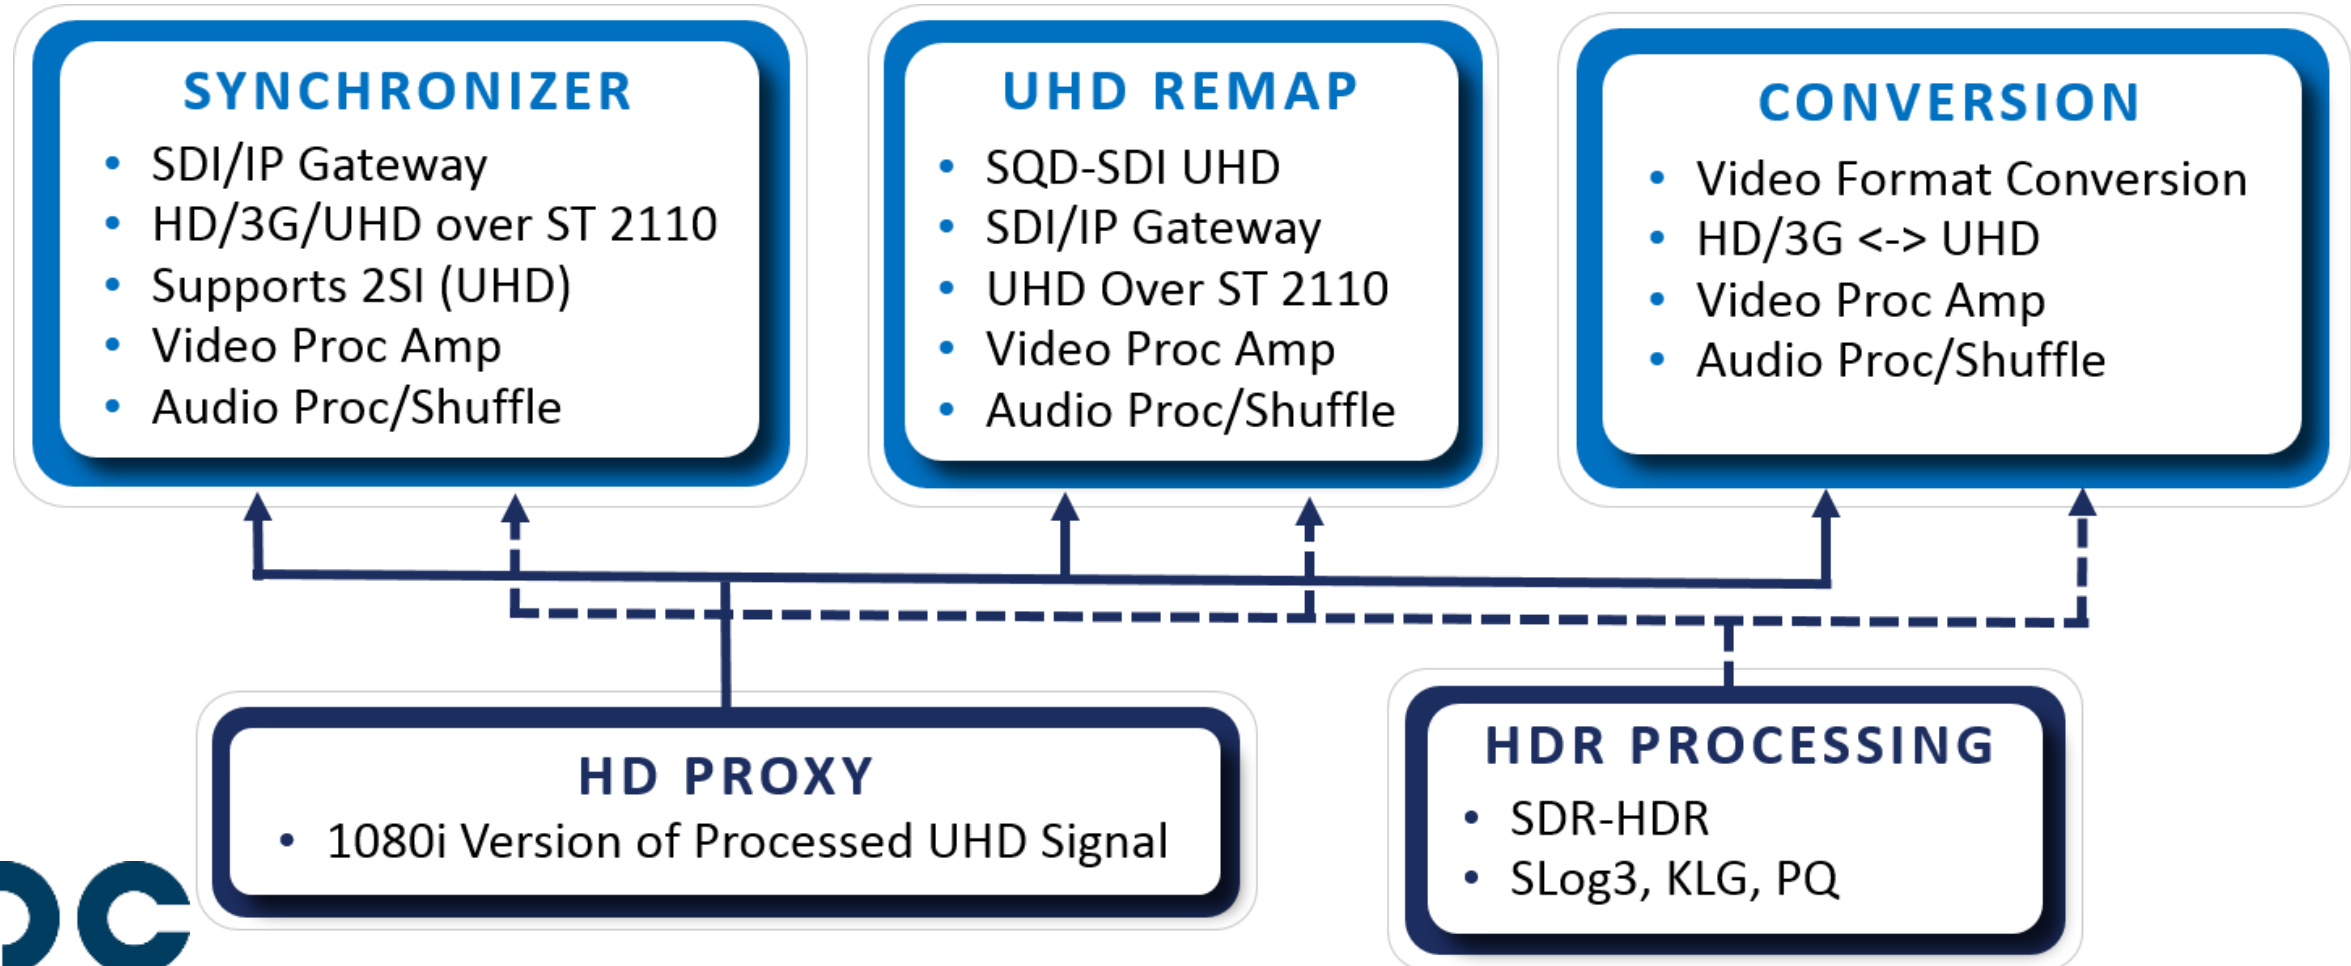

## Gateways

- Signal Processing and Format conversion will be made with Imagine Selenio™ Network Processor
- Interfacing from 4x 3Gbit SDI / 12 Gbit SDI / SMPTE 2022-6 / NAT to 100Gbit/s SMPTE 2022 and vice versa
- 4 independent Processor blocks per unit
- Generates “Proxy” while processing to IP

# SNP processor personalities (modes of operation)

# Experiences with UHD1 HDR

Realtime Network runs stable and solid

No Capacity or Bandwidth issues

Due to Elementary Streams

- Latencies i.e. A/V Runtimes need attention again but are stable and predictable
- Gateways have to modes: Low-Latency or Sync-Mode (like Framestore)
- Audio Mixes are available in the Network in different Timebases

No Embedding or De-Embedding anymore

- Virtualised Embedding in the Orchestrator, Maximum of Flexibility in Audio Handling

Multiviewer Flexibility

- Every Audio / Videosource can be routed to every Monitor, no fixed connection from Multiviewer to Monitor

# Experiences with UHD1 HDR

## PTP

- Not stable in the beginning
- PTP is less stable than Blackburst or Tri-Level-Sync
- No problems if you stay in IP but Wander if you convert to SDI

## Directors Experiences

- No negative feedback because of IP but positive feedback due to the higher flexibility

## Training

- Basic Network training for all Operators
- Super-Users have deeper training
- i.e. IP-Address Conflicts can be solved from normal Operator
- Couple of unicorn's (Hybrid of IP, Audio, Video Experts)

# Experiences with UHD1 HDR

## UHD and HDR

- Soccer Europa league and Champions league → UHD SDR
- Cultural Events like Ballets or Concerts → UHD HDR
- Other Productions mainly 1080i/25 SDR

## HDR Experiences

- HDR is more challenging for Vision-Engineers
- We have the SONY Workflow: Matching in SDR
- Master-Controller is controlling the HDR
- Clear and strict Workflows are necessary

## Focus Control of Cameras

- Again more challenging than in HD

# UHD1 HDR – Main Products

IP Realtime Network and Orchestration.....

ARISTA

Broadcast Controller.....

IP Gateways & Processing.....

Cameras and Vision Mixers.....

Graphics.....

Audio System.....

Umbrella Monitoring.....

# Metecho Technology – Main Products

Post-Production System and Cameras .....		<b>SONY</b>
Robotics.....		
Studio Automation and Graphics .....		
Vision Mixers.....		
Umbrella Monitoring.....		

# Conclusion

IP in ST 2110 works in reality

Expected flexibility fulfilled

Format agnostic approach works

No IP-Experts needed in production → Change is possible and not as hard

Compromises (Gateways) in the truck, much less in the building

Experiences are very helpful for the planning → IP-Lab

Close relationship to manufacturers is needed

Very motivated Employees!

# Thank You
